

Cloud Salez: Cloud POS

Instead of spending lots of money for a localized point of sale (POS) system, businesses can save money by using a cloud POS system to store and process their sales-related data on a remote cloud server for a cheaper price!

How It Works:

1) A product's sales data is collected by a POS device, and the transaction is processed.

2) The sales data is transferred to the Cloud Salez servers, where it is stored and processed.

3) The processed sales data is updated on the Cloud Salez frontend interface, which is accessible from any internet capable device.
