

Cloud Salez: Cloud POS

Instead of spending lots of money for a localized point of sale (POS) system and hiring an engineer, businesses can save money by using a cloud POS system to store and process their sales-related data on a remote cloud server for a cheaper price!

How It Works:

1) A customer's payment information and the product's sales data is collected by a POS device.

2) The data is transferred to the Cloud Salez servers, where the transaction is completed and the sales data is stored and processed.

Cloud Salez

3) The processed sales data is updated in real time on the Cloud Salez frontend interface, which is accessible from any internet capable device.
